**$\beta$ -SULFONYL HYDROXAMIC ACIDS  
AS MATRIX METALLOPROTEINASES INHIBITORS**

## FIELD OF THE INVENTION

5           The present invention relates to novel  $\beta$ -sulfonyl hydroxamic acids, to pharmaceutical compositions containing them, and to the method of using them. The compounds of the invention are inhibitors of matrix metalloproteinases involved in tissue degradation.

10 BACKGROUND OF THE INVENTION

Loss of connective tissue integrity occurs in many disease processes, including osteoarthritis, rheumatoid arthritis, septic arthritis, osteopenias such as osteoporosis, tumor metastasis (invasion and growth), periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, inflammation, asthma and other diseases related to connective tissue degradation. Although there is a high incidence of these diseases in the developed world, there is no treatment that prevents the tissue damage that occurs. Considerable lines of scientific evidence indicate that uncontrolled connective matrix metalloproteinase (MMPs) activity is responsible for the damage, and as a consequence the inhibition of these enzymes has become the target for therapeutic intervention (see Matrisian, L. M., *Bases*, Vol. 14, pp 445-463 (1992); Emonard, H. et al., *Cellular and molecular Biology*, Vol. 36, pp 131-153 (1990); Docherty, A. J. P. et al., *Annals of the Rheumatic*, Vol. 49, pp 469-479 (1990)).

Hydroxamic acid derivatives are a class of known therapeutically active MMPs inhibitors and there are numerous references in the art disclosing a variety of hydroxamic acid derivatives. For example, European Patent Publication 0,606,046 A1 discloses arylsulfonamido-substituted hydroxamic acids useful as matrix metalloproteinase inhibitors. International Publication Nos. WO 95/35275 and WO 95/35276 disclose sulfonamide hydroxamic acid and carboxylic acid derivatives useful as matrix metalloproteinases inhibitors. All these references relate to sulfonamide hydroxamic acids. The compounds of this invention are novel and distinct from all other sulfonamide hydroxamic acids in that the usual nitrogen atom is replaced by a carbon atom. The invention provides sulfonyl hydroxamic acid derivatives.

35       The compounds of the present invention inhibit various enzymes from the matrix metalloproteinase family, predominantly stromelysin and gelatinase, and

hence are useful for the treatment of matrix metallo endoproteinase diseases such as osteoporosis, tumor metastasis (invasion and growth), periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, inflammation, asthma, and other diseases related to connective tissue degradation.

## DETAILED DESCRIPTION OF THE INVENTION

The compounds of this invention can be prepared in accordance to the process discussed below.

In Scheme I,  $R_1$  and  $R_2$  are the groups as defined previously. Substituted malonate esters **2** are either obtained commercially, or can be readily prepared from structure **1** by methods well known to those skilled in the art. For example, reaction of an enolate of structure **1**, generated by an appropriate base in an appropriate solvent, with an alkylating agent  $R_2-I$  ( $I$  is bromo, chloro, tosylate, mesylate, epoxides, etc.) provides the desired substituted malonate esters **2**. See: *Organic Synthesis*, Vol. 1 p 250 (1954); *Organic Synthesis*, Vol. 3, p 495 (1955). Compound **2** is hydrolyzed to mono-acid compound **3** by reaction with one equivalent of an appropriate base such as alkali hydroxide in an appropriate solvent at a temperature ranging from 0° C to 30° C. In the presence of formaldehyde and piperidine in an appropriate solvent such as pyridine, ethanol, dioxane at refluxing temperatures, compound **3** is converted to acrylic esters **4**. In many cases, acrylic esters **4** are commercially available. A thiol ( $H-SR_1$ ) is added to the acrylic ester **4** at room temperature to afford sulfide esters **5** in the presence of either a catalytic amount of alkoxide in alcoholic solvent or a tertiary amine base in chloroform. The resultant sulfides **5** are readily oxidized to sulfones **6** by an oxidizing agent such as meta-chloroperoxybenzoic acid (MCPBA) in an appropriate solvent such as methylene chloride, or using hydrogen peroxide in acetic acid as a solvent. The esters can be hydrolyzed by procedures well known in the art such as using 6N HCl and refluxing

for 10 to 20 hours or using iodotrimethylsilane in chloroform to afford free acids 7. Coupling of acids 7 with hydroxylamine hydrochlorides to form hydroxamates 9 may be achieved by several routes well known to those skilled in the art. For example, acids 7 can be activated by chloroethylformate in dry THF or a similar compatible solvent, or by a carbodiimide condensing agent such as EDC, with or without HOBT, in DMF and methylene chloride. A tertiary amine is required in both situations. The subsequent reaction of activated 7 with hydroxylamine provides the desired hydroxamic acid derivatives. Alternatively, acids 7 may be condensed, using the same reagents as described above, with benzyl-protected hydroxylamine hydrochloride, to produce the protected hydroxamates 8. Compounds 8 are often easier to purify, and may readily be hydrogenolytically cleaved to the free hydroxamates 9 by a palladium catalyst in alcoholic solvents. Other protected hydroxylamines such as tert-butyl hydroxylamine may also be used, and the free hydroxamate can be obtained by treating it with trifluoroacetic acid.

A second method of preparing the compounds of the invention is to utilize commercially available acrylic acids 10 as shown in Scheme II. Treatment of acrylic acids with thiols affords compounds 11. The reaction may be accomplished in refluxing an appropriate solvent such as dioxane with piperidine as a catalyst. See: *Annalen*, Vol. 564, pp 73-78 (1949). A variation of this method is shown in Scheme III in which  $\alpha$ -bromomethyl acrylic acids 12 are reacted with two moles of thiols to afford bis-sulfides 13. Oxidation of the resulting sulfides with meta-chloroperbenzoic acid or with excess hydrogen peroxide provides compound 7 in Scheme II and compound 14 in Scheme III, respectively. The remaining synthetic steps which lead to products 9 and 15 are similar to the procedures outlined in Scheme I.

Schemes IV, V and VI depict methods especially adapted to the preparation of the compounds of formula I wherein the  $R_2$  group contains heteroatoms. In Scheme IV, substituent  $R_4$  is defined as previously. Group I in structure 16 is bromo, chloro, tosylate, mesylate, or epoxides, and may be replaced by an agent  $R_4$ -X-H according to procedures well known in the art (X may be O,  $NR_7$ , S and etc.). The remaining synthetic steps which lead to compound 18 are similar to the procedures outline in Scheme I.

In Scheme V a suitably protected cysteine (P in structure 19 is a protecting group) can be converted to the corresponding thiol 20. After removing the protecting group, a  $R_7$  group (as defined previously) can be introduced into the nitrogen atom

as shown in structure 23. The procedure outlined in Scheme V is discussed in further detail in Synthesis Communication, Vol. 16, No. 5, p. 565 (1986). This method can be carried out for both the racemate or a single enantiomer. Following the general procedures as described above but starting with enantiomerically enriched isomers, the desired single enantiomer, either *R* or *S* can be obtained.

In Scheme VI, structure 12 is first reacted with one equivalent of thiol or sulfinate in a suitable solvent such as toluene in the absence or presence of a suitable base such as sodium bicarbonate or triethyl amine, at ambient temperature or reflux, to afford 25 or 26, respectively. Conversion of 25 to 26 is accomplished with an oxidant such as meta-chloroperbenzoic acid, in a suitable solvent such as methylene chloride at 0° C. Intermediate 26 is reacted with the anion or conjugate acid of W (wherein W is a group attached via a heteroatom such as oxygen, nitrogen or sulfur) in a solvent such as toluene or dimethylformamide, in the absence or presence of a basic catalyst such as sodium bicarbonate or triethyl amine, preferably at reflux to provide intermediate 7, in which the R<sub>2</sub> group may be -CH<sub>2</sub>XR<sub>4</sub>, -CH<sub>2</sub>-het, or -CH<sub>2</sub>-Q. The remaining synthetic steps which lead to final hydroxamic products 9 are similar to the procedures outlined in Scheme I.

In addition to Schemes IV, V and VI, the compounds of formula I wherein the R<sub>2</sub> group contains heteroatoms may also be prepared according to Scheme II by using structure 12. In this method, α-bromomethyl acrylic acid 12 is reacted with one equivalent of anion or conjugate acid of W to provide acrylic acids 10, in which the R<sub>2</sub> group may be -CH<sub>2</sub>-W (wherein W is as defined above). The remaining synthetic steps which lead to final hydroxamic products 9 are similar to the procedures outlined in Scheme II. When W is a thiol or thiolate, the sulfur contained in R<sub>2</sub> may be oxidized to a sulfoxide or sulfone, give rise to, for example, unsymmetrical bis-sulfonyl hydroxamates.

The chemistry in Schemes I, II, IV and VI proceeds through achiral or racemic intermediates and pure enantiomers of the final products may be obtained by resolution of intermediates 5-9 or 11 by chiral chromatography or classical derivatization methods such as chiral salt formation of intermediate 7.

The pharmaceutical compositions of this invention may be prepared by combining the compounds of formula I of this invention with a solid or liquid pharmaceutically acceptable carrier, and optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules, capsules and suppositories. A solid carrier can be at least one substance which may

also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water, water-propylene glycol, and water-polyethylene glycol systems, optionally containing conventional coloring agents, flavoring agents, stabilizers and thickening agents.

10       The pharmaceutical composition is provided by employing conventional techniques. Preferably the composition is in unit dosage form containing an effective amount of the active component, that is, the compounds of formula I according to this invention.

15       The quantity of active component, that is the compounds of formula I according to this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application method, the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

20       In therapeutic use for treating a patient, suffering from or susceptible to diseases involving connective tissue degradation, or inhibiting various enzymes from the matrix metalloproteinase family, including collagenase, stromelysin, and gelatinase, the compounds or pharmaceutical compositions thereof will be administered orally, parenterally and/or topically at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the patient undergoing treatment which will be effective to inhibit such enzymes. Generally, an effective amount of the active compound will be in the range of about 0.1 to about 100 mg/kg. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of connective tissue degradation being treated, and the particular compounds being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of the present invention inhibit various enzymes from the matrix metalloproteinase family, predominantly stromelysin and gelatinase, and hence are useful for the treatment of matrix metallo endoproteinase diseases such as osteoarthritis, rheumatoid arthritis, septic arthritis, osteopenias such as

- 5 osteoporosis, tumor metastasis (invasion and growth), periodontitis, gingivitis, corneal ulceration, dermal ulceration, gastric ulceration, and other diseases related to connective tissue degradation. Such diseases and conditions are well known and readily diagnosed by physician of ordinary skill.

- Pharmaceutical compositions for parenteral administration will generally  
10 contain a pharmaceutically acceptable amount of the compounds according to formula I as a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as; for example, water-for-injection and a suitably buffered isotonic solution having a pH of about 3.5-6. Suitable buffering agents include; for example, trisodium orthophosphate, sodium  
15 bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine, to name a few. The compounds according to formula I generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml. The resulting liquid pharmaceutical composition will be administered so as to obtain the  
20 above-mentioned inhibitory effective amount of dosage. The compounds of formula I according to this invention are advantageously administered orally in solid and liquid dosage forms.

- The compounds and their preparations of the present invention will be better understood in connection with the following examples, which are intended as an  
25 illustration of and not a limitation upon the scope of the invention.

**EXAMPLE 1** Preparation of N-hydroxy 2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionamide.

Step 1 Preparation of benzylmalonic acid monoethyl ester.

Benzylmalonic acid diethyl ester (10 g, 40 mmol) in 25 mL of ethanol is cooled to 0° C. Potassium hydroxide (2.5 g, 40 mmol) dissolved in 25 mL of ethanol is added dropwise over 50 minutes. The cooling bath is removed and the mixture is stirred for one additional hour. The volume of solvent is reduced by evaporation *in vacuo*, and the residual solution is poured into aqueous sodium bicarbonate solution and extracted twice with ethyl acetate. The aqueous phase is acidified with aqueous 10% HCl and extracted twice with ethyl acetate. The organic phase is dried with a brine extraction, filtered from anhydrous sodium sulfate, and concentrated *in vacuo*, yielding 8.08 g of the title compound as a colorless oil.

Step 2 Preparation of 2-benzyl-2-propenoic acid ethyl ester.

Benzylmalonic acid monoethyl ester (8.0 g, 36 mmol), 7 mL of pyridine, 0.36 mL (3.6 mmol) of piperidine, and 1.06 g (35 mmol) of paraformaldehyde is refluxed under nitrogen for 1.5 hours in an oil bath maintained at 130° C. After cooling for 0.5 hours the mixture is partitioned between 100 mL of water and 100 mL of hexane. The aqueous phase is re-extracted with 50 mL of hexane. The organic phase is washed with aqueous 10% HCl, water, 1 M sodium bicarbonate, and brine. It is dried over anhydrous sodium sulfate and concentrated *in vacuo*, yielding 5.8 g of the title compound as a colorless oil.

Step 3 Preparation of 2-[(4-methoxybenzenethio)methyl]-3-phenyl-propenoic acid ethyl ester.

4-Methoxybenzenethiol (0.6 mL, 4.7 mmol) in 1 mL of ethanol is cooled in an ice bath with stirring. Ethanolic sodium ethoxide solution 0.13 mL (0.34 mmol) is added. After 15 minutes 1.0 g (5.3 mmol) of 2-benzyl-2-propenoic acid ethyl ester in 1 mL of ethanol is added dropwise over about 2 minutes. The ice bath is removed and the reaction mixture is allowed to stir for 17 hours. The mixture is evaporated *in vacuo* and partitioned between ethyl acetate and aqueous 5% HCl. The organic phase is concentrated and chromatographed over silica gel, eluting with hexane:acetone (98:2), to afford 1.04 g of the title compound as a colorless oil.

Step 4 Preparation of 2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionic acid ethyl ester.

To a solution of 2-[(4-methoxybenzenethio)methyl]-3-phenyl-propionic acid ethyl ester (1.51 g, 4.6 mmol) in 50 mL of methylene chloride, cooled in an ice bath, is added 2.17 g (10 mmol) of solid MCPBA portion wise over 5 minutes. The cooling bath is removed, and the mixture is stirred at room temperature overnight. The suspension is filtered and the solids washed with methylene chloride. The organic

solution is extracted with three portions of 1M sodium bicarbonate, dried by extraction with brine, filtered from anhydrous sodium sulfate, and concentrated. Chromatography on silica gel, eluting with methylene chloride:acetone (99:1), afforded 1.31 g of the title compound as a colorless oil.

- 5    Step 5            Preparation of 2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionic acid.

A mixture of 0.56 g (1.5 mmol) of 2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propanoic acid ethyl ester and 8 ml of 6N HCl is heated at 115 °C for 17 hours. The mixture is transferred to 100 ml of ice-water and extracted with two  
10    portions of ethyl acetate. The organic phase is extracted with three 50 mL portions of aqueous 5% sodium bicarbonate. The bicarbonate solution is poured over ice and acidified with concentrated HCl. The acidified aqueous mixture is extracted with three 50 mL portions of ethyl acetate and the combined organic extracts are concentrated *in vacuo* to yield 0.45 g of the title compound as a white solid.

- 15    Step 6            Preparation of N-benzyloxy-2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionamide.

A solution of 2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionic acid (1.05 g, 3.14 mmol) and 0.69 mL (6.3 mmol) of NMM in dry THF, under nitrogen, is cooled in an ice bath. Ethyl chloroformate (0.33 mL, 3.5 mmol) in 7 mL of THF is  
20    added dropwise over 5 minutes. The suspension is stirred at 0° C for 10 minutes, after which a slurry of O-benzylhydroxylamine hydrochloride (0.64 g, 4 mmol) and NMM (0.44 mL, 4 mmol) in 7 mL of THF is introduced in several portions. The mixture is stirred for 10 minutes and stored at 10° C overnight. The mixture is allowed to warm to room temperature for 0.5 hours, and is then partitioned between  
25    ethyl acetate and aqueous 10% HCl. The organic phase is washed with water, three portions of 1 M sodium bicarbonate and brine. It is dried over anhydrous sodium sulfate, concentrated and chromatographed on silica gel, eluting with 40% - 50% ethyl acetate in hexanes. This affords 1.26 g of the title compound as a colorless oil.

- 30    Step 7            Preparation of N-hydroxy-2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionamide.

N-benzyloxy-2-[(4-methoxybenzenesulfonyl)methyl]-3-phenyl-propionamide (1.25 g, 2.85 mmol) is dissolved in 45 mL of ethanol. To this is added 0.36 g of palladium hydroxide on carbon (Pearlman's catalyst), and the suspension is placed in a shaker under 15 psi of hydrogen for 2.25 hours. The catalyst is filtered off,  
35    washing with ethanol, and the ethanol solution is concentrated *in vacuo* to afford, after evaporation from methylene chloride, 0.875 g of the title compound as a white

solid.

#### EXAMPLE 21 Biological Activity Test

5 Inhibitory activity is evaluated in one or more of the MMP enzymes (stromelysin, gelatinase, and collagenase) in vitro using particle concentration fluorescence assay. An inhibitor binds to MMP enzymes which prevents the degradation of a substrate by stromelysin, gelatinase, or collagenase. The substrate has attached to it a fluorescein and a biotin moiety. The intact substrate then binds  
10 to an avidin-coated particle via the biotin moiety. Once the particle is washed and dried, a fluorescent signal is generated since the fluorescent group is attached to the particle. Without an inhibitor present, the substrate is degraded by MMP enzymes and the fluorescein group is removed, therefore, no fluorescent signal can be detected. Testing compounds are dissolved in DMSO to the desired concentration,  
15 then the solutions are diluted to 1:5 with MMP buffer (50 mM Tris-HCl, pH 7.5; 150 mM NaCl; 0.02%  $\text{NaN}_3$ ). Serial two-fold dilutions of each compound are prepared. A concentrated, activated enzyme solution is transferred into each plate of the testing compounds, and the mixture is incubated at room temperature for 15 minutes. Thawed MMP substrate is then added into all plates, and the plates are  
20 incubated in the dark for 1-3 hours at room temperature. At this point, the substrate mixture is mixed with 0.1% avidin-coated polystyrene particles. After 15 minutes, the fluorescence values are measured following filtration and washing of the beads.  $K_i$  values are then calculated. Inhibitory data for the compounds of this invention are shown in TABLE 1. Compounds with lower  $K_i$  values are expected to  
25 be more effective as MMP inhibitors. It is expected that a compound with a  $K_i$  less than 15  $\mu\text{M}$  against stromelysin will display therapeutic effects in connective tissue disorders.

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claim(s) 11-17  
is(are) directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
